

# Post-Launch Support Runbook

## Meridian Group Data Platform Consolidation

### Routine operations

| Task                                | Frequency                             | How                                                               |
|-------------------------------------|---------------------------------------|-------------------------------------------------------------------|
| Refresh reconciliation and KPI data | As new invoices or bank data arrive   | Re-run the migration script, then the reconciliation/KPI pipeline |
| Vendor validation sweep             | Monthly, plus every new-vendor intake | Run the vendor validation script                                  |
| Dashboard review                    | Weekly                                | Check the backlog-by-month trend for any uptick                   |

### Common issues

| Symptom                                                 | Likely cause                                                                             | Fix                                                                    |
|---------------------------------------------------------|------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Dashboard shows stale numbers                           | The KPI export wasn't regenerated after the last data refresh                            | Re-run the reconciliation/KPI pipeline                                 |
| A vendor appears twice after migration                  | Name normalization didn't catch a formatting variant it hasn't seen before               | Extend the vendor name normalizer and re-run                           |
| A paid invoice sits in the backlog indefinitely         | The matching bank transaction was never entered, or entered against the wrong invoice ID | Check the unmatched-invoices report, correct the source record, re-run |
| Vendor validation flags a vendor that was just approved | The active flag wasn't updated consistently across every entity using that vendor        | Update the flag everywhere it's used, then re-run validation           |

### Escalation

| Severity                               | Response                                                                      |
|----------------------------------------|-------------------------------------------------------------------------------|
| Pipeline fails to run                  | Business Systems Analyst investigates same day                                |
| A single vendor/invoice discrepancy    | Logged and resolved within the normal reconciliation cycle                    |
| Error rate trending back up group-wide | Re-open the vendor setup or reconciliation workstream, not just a one-off fix |

## Ownership

This platform has one accountable owner rather than being maintained informally by whichever entity happens to notice a problem first — the same principle the rest of the project is built on.
